Let the fans be damned. Lexapro for depression is a better choice than Prozac The problem with the Lexapro off-label use is that it's coming at the wrong time (Image: Bloomberg) In terms of business, depression is not a big draw. It is much cheaper to treat mild depressive symptoms with Wellbutrin, Effexor or Prozac, because they have a very high relapse rate. So pharmaceutical companies have had to come up with rationales for their products. One is the use of their medicines to help other conditions. This can be useful, as it is not possible to design a drug for every case. But it leads to a strange world of medical exceptions that go beyond the normal scientific process. There is much more attention paid to treating borderline cases, alcohol addiction or obesity. For example, the “long-term use of an anti-depressant has an increased risk of suicidal behaviour and violent behaviour”, but there is no mention of drinking a pint of beer. While pharmaceutical companies use an army of scientific names to try to make their products appear scientific and safe, the failure rate of drugs that are being used for mental health problems is much higher than for a real illness like diabetes. Medical exceptions In fact, the failure rate for drugs for depression is estimated to be as high as 70 per cent, according to a 2008 review in JAMA, the journal of the American Medical Association. One method of assessing the true level of effectiveness and safety of medical treatments is through clinical trials. But as the author Harry Lawford points out, the huge numbers of people recruited and studied by drugs firms make this impossible to do. So the industry has to come up with individualised treatments, and for depression this has led to the use of medically-specific cognitive behavioural therapy. It involves a “less a cure than a reprieve”, as the evidence suggests it is only effective for the minority of patients who respond to it. For the rest, the industry has tried a range of new drugs. While this has helped to reduce the rate of relapse, there is little evidence they are any better at treating patients than the older, cheaper drugs. Two of the most-recommended medicines for depression, Prozac and Wellbutrin, are potentially dangerous. A recent study in Switzerland suggested that the higher the dose of Prozac a patient was taking the more
